

Sexual Assault Care® products forensiX

The forensiX Sexual Assault Care® product line provides kits for the complete medical examination of a sexual assault victim and for the professional preservation of evidence.

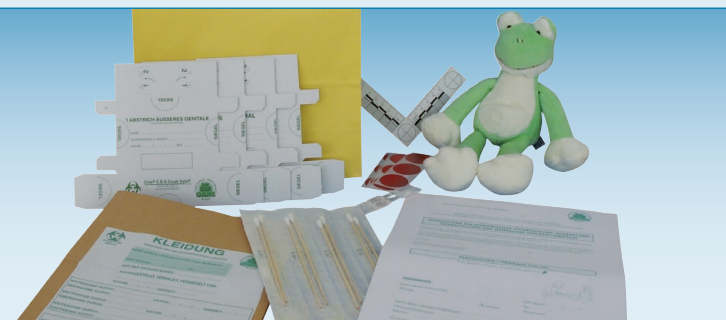

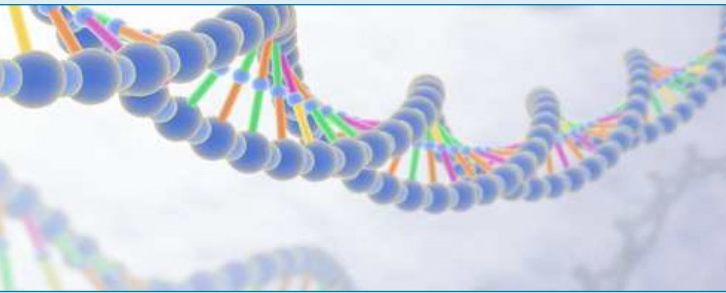

forensiX DNA collection products are one of the best solutions for DNA sampling on the market because collection, transport, processing, storage and archiving of sample swabs can be carried out at room temperature and without pre-drying.

DNA SAMPLING AFTER SEXUAL ASSAULT

Following a sexual assault, a thorough medical examination and professional collection of biological evidence for DNA analysis forms a critical part of successfully resolving a criminal case.

Prionics' forensiX sampling products conform to the highest quality standards required for the preservation of DNA evidence and are used widely by many professionals in forensic medicine, hospitals and police departments throughout the world.

Prionics acquired the forensiX product lines in July 2008 and now offers a comprehensive range of products for obtaining DNA samples from victims of sexual assault.

WHAT ARE THE BENEFITS OF THE forensiX PRODUCTS?

The forensiX **Sexual Assault Care**® Examination kits are highly reliable tools for collecting and preserving medical and biological evidence for DNA analysis. After sample taking, the forensiX cotton swabs are dried in a dedicated storage carton. DNA degradation, one of the biggest risks in forensic sampling, is avoided through the drying process.

DNA samples placed in forensiX containers do not require cooling. Transport, storage and archiving are all possible at room temperature. Each storage box is secured with three tamper-proof seals, which are labeled distinctively, allowing an uninterrupted chain of evidence.

Prionics forensiX sexual assault kits include the carton evidence collection boxes, all sampling materials and detailed instructions for taking DNA swabs. The 8-step checklist and protocol provides an easy to follow guide for examinations, ensuring reliable safeguarding of evidence. Instructions in the kits are available in German, French and English.

Depending on the nature and complexity of the assault we offer 4 different kits

The forensiX **Sexual Assault Care**® Examination kit «complete» for complex cases contains 16 evidence collection boxes with cotton swabs for use on all relevant parts of the body, sterile water dispensers, and a selection of examination and packaging material such as clothing bags, combs and sampling tubes for blood and urine.

The forensiX **Sexual Assault Care**® Examination kit «mini» is a smaller version of the complete kit containing 10 evidence collection boxes and examination materials.

The forensiX **Sexual Assault Care**® Examination kit «kids» is a specially designed and equipped kit for use in cases involving children who have been sexually assaulted.

The forensiX **Sexual Assault Care**® Examination kit «male» is used to gather and preserve medical and biological evidence for DNA analysis from male suspects or victims of sexual assault.

All forensiX products fully comply with all known requirements for DNA sampling devices.
